^a Linear regression, adjusted for sex, age, BMI (underweight/ normal weight/ overweight/ obesity), physical activity (inactive/ low/ medium and high), prevalence of cardiovascular disease and diabetes, and batch effect, as well as cumulative dose and time since cessation of smoking each other.

Supplemental Material, Figure S1. Examples for results of MassArray Analysis of *F2RL3* methylation. The graphs show the detection intensity (y-axis) of amplicon fragments after base-specific cleavage. Different masses for originally methylated and non-methylated CpG are labeled on the x-axis. The proportion of methylated CpG at these loci thus can be determined by the ratio of detection intensities at masses corresponding to fragments originating from methylated and non-methylated CpG (blue and red vertical lines, respectively). The graphs were taken from a single sample with 86%, 80%, and 90% methylation at *F2RL3* CpG_2, CpG_4 and CpG5, respectively (from left to right).
